Department of Electrical and Electronics Engineering, BIT Jaipur

Development of a Microcontroller Based Technology of a Pressure Sensitive Bed for Immovable Patients to Reduce the Risk of Bed Sore

Sanctioned by: Indian Council of Medical Research, New Delhi

Amount Sanctioned: Rs. 9,65,941/-

Aim

The aim was to design and develop a bed in which surface pressure of different parts will change automatically after a predetermined time. This was done by inflation and deflation action at different pressure by air supply unit (Compressor/ Vacuum pumps) whose motors are controlled through a programmable microcontroller. The segment or cell wise pressure was changed through microcontrollers in this innovative technology.
